1 Relativization of universal algebra

2 Birkhoff's variety theorem

3 Filtered colimit elimination

4 Computation of strongly connected components

# Single-sorted algebras

## Definition

A (single-sorted) algebra consists of:

- a base set  $A$ ;
- operators  $\sigma: A^n \rightarrow A$  ( $n \geq 0$ );
- equations.

## Example

A group consists of:

- a base set  $G$ ;
- operators  $e: 1 \rightarrow G$ ,  $i: G \rightarrow G$ ,  $m: G^2 \rightarrow G$ ;
- equations  $m(e, x) = x = m(x, e)$ ,  $m(x, i(x)) = e = m(i(x), x)$ ,  
 $m(m(x, y), z) = m(x, m(y, z))$ .

# Multi-sorted algebras

## Definition

$S$ : a set. (the set of sorts)

An  $S$ -sorted algebra consists of:

- base sets  $(A_s)_{s \in S}$  indexed by  $S$ ;
- operators  $\sigma: A_{s_1} \times \cdots \times A_{s_n} \rightarrow A_s$ ;
- equations.

## Example

A chain complex consists of:

- base sets  $(A_n)_{n \in \mathbb{Z}}$ ;
- operators  $0_n: 1 \rightarrow A_n$ ,  $-_n: A_n \rightarrow A_n$ ,  $+_n: A_n \times A_n \rightarrow A_n$ ,  
 $d_n: A_n \rightarrow A_{n+1}$ ;
- appropriate equations.

This is an  $\mathbb{Z}$ -sorted algebra.

# The free-forgetful adjunctions

$$\begin{array}{c} \mathbf{Grp} \\ F \uparrow \downarrow U \\ \mathbf{Set} \end{array} \left( \dashv \right)$$

$$\begin{array}{c} \mathbf{Ch} \\ F \uparrow \downarrow U \\ \mathbf{Set}^{\mathbb{Z}} \end{array} \left( \dashv \right)$$

$$\begin{array}{c} \mathbf{Alg}(\Omega, E) \\ F \uparrow \downarrow U \\ \mathbf{Set}^S \end{array} \left( \dashv \right)$$

$(\underbrace{\Omega}_{\text{operators}}, \underbrace{E}_{\text{equations}})$ : an  $S$ -sorted algebraic theory.

# Relativization via monads

## Theorem ([Lin69])

There is an equivalence

$$\mathbf{Th}^S \simeq \mathbf{Mnd}_f(\mathbf{Set}^S).$$

Here,

$\mathbf{Th}^S$ : the category of  $S$ -sorted algebraic theories,

$\mathbf{Mnd}_f(\mathbf{Set}^S)$ : the category of finitary monads on  $\mathbf{Set}^S$ .

$S$ -sorted algebraic theory = finitary monad on  $\mathbf{Set}^S$

↓ generalize

???

$\mathcal{A}$ -relative algebraic theory =  $\kappa$ -ary monad on  $\mathcal{A}$   
( $\mathcal{A}$ : a locally  $\kappa$ -presentable category)

# Relative algebraic theories

## Informal definition [Kaw23a]

$\mathcal{A}$ : a (locally presentable) category

An  $\mathcal{A}$ -relative algebraic theory consists of:

- a set  $\Omega$  of partial operators;
- a set  $E$  of implications  $\dots ( \underbrace{\text{YYY}}_{\text{postcondition}} \text{ whenever } \underbrace{\text{XXX}}_{\text{precondition}} )$

such that

- For each operator  $\omega \in \Omega$ , its domain must be defined by “ $\mathcal{A}$ ’s language.”
- For each implication in  $E$ , its precondition must be written in “ $\mathcal{A}$ ’s language.”

# A generalized Linton theorem

## Theorem ([Kaw23a; Kaw24])

For a locally  $\kappa$ -presentable category  $\mathcal{A}$ , there is an equivalence

$$\mathbf{Th}_{\kappa}^{\mathcal{A}} \simeq \mathbf{Mnd}_{\kappa}(\mathcal{A}).$$

Here,

$\mathbf{Th}_{\kappa}^{\mathcal{A}}$ : the category of  $\mathcal{A}$ -relative ( $\kappa$ -ary) algebraic theories,

$\mathbf{Mnd}_{\kappa}(\mathcal{A})$ : the category of  $\kappa$ -ary monads on  $\mathcal{A}$ .

↑ generalize

## Recall (Linton's theorem)

$$\mathbf{Th}_{\aleph_0}^S \simeq \mathbf{Mnd}_{\aleph_0}(\mathbf{Set}^S).$$

# Example: small categories

## Example

A **small category** consists of:

- a base quiver  $\text{mor}\mathcal{C} \xrightleftharpoons[c]{d} \text{ob}\mathcal{C}$ ;
- a total operator  $\text{id}: \text{ob}\mathcal{C} \rightarrow \text{mor}\mathcal{C}$ ;
- a **partial** operator  $\circ: \text{mor}\mathcal{C} \times \text{mor}\mathcal{C} \rightarrow \text{mor}\mathcal{C}$  such that

$$g \circ f \text{ is defined iff } d(g) = c(f)$$

which satisfy the following:

- $d(\text{id}(x)) = x$  and  $c(\text{id}(x)) = x$ ;
- $d(g \circ f) = d(f)$  and  $c(g \circ f) = c(g)$  whenever  $d(g) = c(f)$ ;
- $f \circ \text{id}(d(f)) = f$  and  $\text{id}(c(f)) \circ f = f$ ;
- $(h \circ g) \circ f = h \circ (g \circ f)$  whenever  $d(h) = c(g)$  and  $d(g) = c(f)$ .

Small categories are algebras over quivers.

# Further examples

## Example

small categories (eg.1)	$\rightsquigarrow$	quivers
UDO semirings (eg.2)	$\rightsquigarrow$	posets
partial Boolean algebras	$\rightsquigarrow$	graphs
monoid-graded rings	$\rightsquigarrow$	monoid-graded sets
generalized complete metric spaces	$\rightsquigarrow$	generalized metric spaces
Banach spaces	$\rightsquigarrow$	pointed metric spaces

1 Relativization of universal algebra

2 Birkhoff's variety theorem

3 Filtered colimit elimination

4 Computation of strongly connected components

# Equational classes

## Definition

$(\Omega, E)$ : a single-sorted algebraic theory. A full subcategory  $\mathcal{C} \subseteq \mathbf{Alg}(\Omega, E)$  is **definable (by equations)** if  $\mathcal{C} = \mathbf{Alg}(\Omega, E + \exists E')$ , i.e.,  $\mathcal{C}$  can be defined by adding equations.

## Example

$\{\text{commutative monoids}\} \subseteq \mathbf{Mon}$  is definable by the equation  $xy = yx$ .

## Example

$\{\text{invertible monoids}\} \subseteq \mathbf{Mon}$  is **not** definable by equations.  
not definable by equations.

*How can we prove this?*

# Birkhoff's variety theorem

## Birkhoff's variety theorem [Bir35]

$(\Omega, E)$ : a single-sorted algebraic theory.  $\mathcal{E} \subseteq \mathbf{Alg}(\Omega, E)$ : fullsub.

TFAE:

- 1  $\mathcal{E} \subseteq \mathbf{Alg}(\Omega, E)$  is definable by equations.
- 2  $\mathcal{E} \subseteq \mathbf{Alg}(\Omega, E)$  is closed under products, subobjects, and quotients.

closed under products:  $A_i \in \mathcal{E} \implies \prod_i A_i \in \mathcal{E}$ .

closed under subobjects:  $B \subseteq A$ : sub,  $A \in \mathcal{E} \implies B \in \mathcal{E}$ .

closed under quotients:  $A \twoheadrightarrow B$ : surj,  $A \in \mathcal{E} \implies B \in \mathcal{E}$ .

## Corollary

$\{\text{invertible monoids}\} \subseteq \mathbf{Mon}$  is not definable by equations.

## Proof.

$\frac{\mathbb{N}}{\neg\text{invertible}} \subset \frac{\mathbb{Z}}{\text{invertible}} \rightsquigarrow \{\text{inv. monoids}\} \subseteq \mathbf{Mon}$ : not closed under subobjects  $\square$

# A generalized Birkhoff's theorem

## Theorem ([Kaw23a; Kaw24])

$(\Omega, E)$ : an  $\mathcal{A}$ -relative ( $\kappa$ -ary) algebraic theory.  $\mathcal{E} \subseteq \mathbf{Alg}(\Omega, E)$ : fullsub.  
TFAE:

- ①  $\mathcal{E} \subseteq \mathbf{Alg}(\Omega, E)$  is definable.
- ②  $\mathcal{E} \subseteq \mathbf{Alg}(\Omega, E)$  is closed under products, closed subobjects,  $(U, \kappa)$ -local retracts, and  $\kappa$ -filtered colimits.

single-sorted alg. (Set-relative alg.)		$\mathcal{A}$ -relative alg.
products	$\rightsquigarrow$	products
subobjects	$\rightsquigarrow$	<i>closed subobjects</i>
quotients	$\rightsquigarrow$	<i><math>(U, \kappa)</math>-local retracts</i>
	$\rightsquigarrow$	<i><math>\kappa</math>-filtered colimits</i> (new)

# The filtered colimit elimination problem

## Question

Why can the closure property under filtered colimits be eliminated in the case of **Set**-relative algebras?

## Answer

The category **Set** satisfies a “noetherian” condition.

- 1 Relativization of universal algebra
- 2 Birkhoff's variety theorem
- 3 Filtered colimit elimination
- 4 Computation of strongly connected components

# A noetherian condition for categories

## Definition ([Kaw23b])

A category  $\mathcal{A}$  satisfies the **ascending chain condition (ACC)** if it has no chain  $A_0 \rightarrow A_1 \rightarrow A_2 \rightarrow \cdots$  of objects such that there is no morphism  $A_n \leftarrow A_{n+1}$  for all  $n$ .

## Example

Set satisfies ACC.

## Proof.

Let  $A_0 \rightarrow A_1 \rightarrow \cdots$  be an  $\omega$ -chain of sets. If there is no map  $A_0 \leftarrow A_1$ , then  $A_0 = \emptyset$  and  $A_1 \neq \emptyset$ . Thus, a map  $A_1 \leftarrow A_2$  exists. □

## Example

**Quiv**, the category of quivers, does **not** satisfy ACC.

### Proof.

Let  $Q_n$  denote the  $n$ -path

$$Q_n: \quad 0 \rightarrow 1 \rightarrow 2 \rightarrow \cdots \rightarrow n.$$

Then, the inclusions yields a chain  $Q_0 \rightarrow Q_1 \rightarrow Q_2 \rightarrow \cdots$ , and there is no quiver morphism  $Q_n \leftarrow Q_{n+1}$ . □

## Example

**Ring**, the category of rings, does **not** satisfy ACC.

### Proof.

This is because there is a non-trivial chain of finite fields

$$\mathbb{F}_p \hookrightarrow \mathbb{F}_{p^2} \hookrightarrow \mathbb{F}_{p^4} \hookrightarrow \cdots \hookrightarrow \mathbb{F}_{p^{2^n}} \hookrightarrow \cdots .$$

□

# Relation to ordinary ACC

## Definition

- Objects  $X$  and  $Y$  are **strongly connected** if there are morphisms  $X \rightarrow Y$ ,  $Y \rightarrow X$ .
- An equivalence class under strong connectedness is called a **strongly connected component**.
- $\sigma(\mathcal{A})$ : the large poset of all strongly connected components in a category  $\mathcal{A}$ .  
(the *posetification* of  $\mathcal{A}$ )

## Proposition

A category  $\mathcal{A}$  satisfies ACC  $\Leftrightarrow$  the large poset  $\sigma(\mathcal{A})$  satisfies ACC.

## Proposition

$\mathbf{Set}^S$  satisfies ACC  $\Leftrightarrow$  the set  $S$  is finite.

## Proof.

Since the posetification  $\sigma$  preserves products, the following holds:

$$\sigma(\mathbf{Set}^S) \cong \sigma(\mathbf{Set})^S \cong \{0 < 1\}^S \cong \mathcal{P}(S).$$

“ $\mathcal{P}(S)$  satisfies ACC  $\Leftrightarrow S$ : finite” is trivial. □

# Filtered colimit elimination

## Theorem ([Kaw23b; Kaw24])

$(\Omega, E)$ : an  $\mathcal{A}$ -relative ( $\kappa$ -ary) algebraic theory.  $\mathcal{E} \subseteq \mathbf{Alg}(\Omega, E)$ : fullsub.  
Assume that  $\mathcal{A}$  satisfies ACC.

TFAE:

- ①  $\mathcal{E} \subseteq \mathbf{Alg}(\Omega, E)$  is definable.
- ②  $\mathcal{E} \subseteq \mathbf{Alg}(\Omega, E)$  is closed under products, closed subobjects,  $(U, \kappa)$ -local retracts, and  $\kappa$ -filtered colimits.

# Some applications of filtered colimit elimination

## Corollary

- **Set** satisfies ACC.
  - ↪  $\text{fil.colim.elim.}$  holds for **single-sorted alg.**
  - ↪ The classical Birkhoff theorem [Bir35]
- **Set<sup>n</sup>** satisfied ACC.
  - ↪  $\text{fil.colim.elim.}$  holds for **finite-sorted alg.**
  - ↪ This subsumes a result in [ARV12].
- **Pos** satisfied ACC.
  - ↪  $\text{fil.colim.elim.}$  holds for **ordered alg.**
  - ↪ This subsumes a result in [Blo76].
- **Met<sub>∞</sub>**, the category of generalized metric spaces, satisfied ACC.
  - ↪  $\text{fil.colim.elim.}$  holds for **metric alg.**
  - ↪ This subsumes a result in [Hin16].

# Filtered colimit elimination: sketch of proof

fullsub  $\mathcal{E} \subseteq \mathbf{Alg}(\Omega, E)$ : closed under products, closed sub,  $(U, \kappa)$ -local ret.  
( $A_J$ ) $_{J \in \mathbb{I}}$ : a  $\kappa$ -filtered diagram s.t.  $A_J \in \mathcal{E}$ .

For each  $J \in \mathbb{I}$ , we can construct a “nice” wide sub-diagram  $\mathbb{I}_J \subseteq \mathbb{I}$ .

$$\begin{array}{ccc} \prod_{I \in \mathbb{I}} A_I & & \\ \uparrow m_J & \nwarrow m & \\ B_J & \xrightarrow{\pi_J} & A_J \\ & \nearrow & \nearrow \\ & \text{Colim}_{J \in \mathbb{I}} B_J & \xrightarrow{\text{Colim}_{J \in \mathbb{I}} \pi_J} \text{Colim}_{J \in \mathbb{I}} A_J \end{array} \quad \text{in } \mathbf{Alg}(\Omega, E)$$

$\rightsquigarrow \mathcal{E} \subseteq \mathbf{Alg}(\Omega, E)$  is closed under  $\kappa$ -filtered colimits.

□

- 1 Relativization of universal algebra
- 2 Birkhoff's variety theorem
- 3 Filtered colimit elimination
- 4 Computation of strongly connected components

# Locally connected categories

## Definition

$C \in \mathcal{C}$  is **connected**  $\stackrel{\text{def}}{\Leftrightarrow} \mathcal{C}(C, \bullet): \mathcal{C} \rightarrow \mathbf{Set}$  preserves small coproducts.

## Example

- ① A top. space  $X \in \mathbf{Top}$  is connected  $\Leftrightarrow$  it is connected (in the usual sense).
- ② A set  $X \in \mathbf{Set}$  is connected  $\Leftrightarrow$  it is a singleton.
- ③ A category  $\mathcal{C} \in \mathbf{Cat}$  is connected  $\Leftrightarrow$  all objects are connected by zig-zags.
- ④ A presheaf  $P \in \mathbf{Set}^{\mathcal{C}^{\text{op}}}$  is connected  $\Leftrightarrow$  so is the caty of elements  $\int P$ .

## Definition

$\mathcal{C}$  is **locally connected**  $\stackrel{\text{def}}{\Leftrightarrow}$  it has small coproducts and every object is a small coproduct of connected objects.

## Example

- $\mathbf{Top}$  is **not** locally connected.
- $\mathbf{Set}$ ,  $\mathbf{Cat}$ , and any presheaf categories  $\mathbf{Set}^{\mathcal{C}^{\text{op}}}$  are locally connected.

# A characterization of locally connected categories

## Definition

Given a category  $\mathcal{A}$ , we define a category **Fam**( $\mathcal{A}$ ) (*the category of families*):

- object  $\cdots$  a small family  $(A_i \in \mathcal{A})_{i \in I}$ ;
- morphism  $(A_i)_I \rightarrow (B_j)_J \cdots$  a map  $I \xrightarrow{f} J$  together with a family  $(A_i \xrightarrow{f_i} B_{f(i)} \text{ in } \mathcal{A})_{i \in I}$ .

## Theorem ([CV98])

$\mathcal{C}$  is locally connected  $\Leftrightarrow \mathcal{C} \simeq \mathbf{Fam}(\mathcal{A})$  for some  $\mathcal{A}$ .

$\mathcal{C}$ : locally connected  $\leadsto \mathcal{C} \simeq \mathbf{Fam}(\mathcal{C}_{\text{conn}})$   
( $\mathcal{C}_{\text{conn}} \subseteq \mathcal{C}$ : the fullsub of all connected objects)

# ACC for locally connected categories

## Definition

- $L \subseteq \text{ob}\mathcal{A}$  is called a **lower class**  $\stackrel{\text{def}}{\Leftrightarrow}$  “ $X \rightarrow Y \in L$ ” implies  $X \in L$ .
- $\mathbb{L}(\mathcal{A})$ : the (large) poset of lower classes on  $\mathcal{A}$ .

## Lemma ([Kaw23b])

$\mathcal{C}$ : locally connected  $+\alpha \rightsquigarrow \sigma(\mathcal{C}) \cong \mathbb{L}(\mathcal{C}_{\text{conn}}) (\cong \mathbb{L}\sigma(\mathcal{C}_{\text{conn}}))$ .

## Proof.

$$\sigma(\mathcal{C}) \cong \sigma(\mathbf{Fam}(\mathcal{C}_{\text{conn}})) \cong \mathbb{L}(\mathcal{C}_{\text{conn}}).$$

## Lemma ([Kaw23b])

The poset  $\mathbb{L}(\mathcal{A})$  satisfies ACC  $\Leftrightarrow$  Every lower class on  $\mathcal{A}$  is *finitely generated*.

## Corollary ([Kaw23b])

A locally connected category  $\mathcal{C}$  satisfies ACC  $\Leftrightarrow$  Every lower class on  $\mathcal{C}_{\text{conn}}$  is finitely generated.

**Cospan** := **Set**<sup>[ $\cdot \rightarrow \cdot \leftarrow \cdot$ ]</sup> (presheaf category)

**Cospan** has only 6 strongly connected components:

$$\begin{aligned}
 S_0: & \quad \begin{array}{ccc} & \emptyset & \\ \nearrow & & \nwarrow \\ \emptyset & & \emptyset \end{array}, & S_1: & \quad \begin{array}{ccc} & 1 & \\ \nearrow & & \nwarrow \\ \emptyset & & \emptyset \end{array}, & S_2: & \quad \begin{array}{ccc} & 1 & \\ \nearrow & & \nwarrow \\ 1 & & \emptyset \end{array}, \\
 S_3: & \quad \begin{array}{ccc} & 1 & \\ \nearrow & & \nwarrow \\ \emptyset & & 1 \end{array}, & S_4: & \quad \begin{array}{ccc} \lceil 0 \rceil & 2 & \lceil 1 \rceil \\ \nearrow & & \nwarrow \\ 1 & & 1 \end{array}, & S_5: & \quad \begin{array}{ccc} & 1 & \\ \nearrow & & \nwarrow \\ 1 & & 1 \end{array}.
 \end{aligned}$$

On the other hand,

$$\sigma(\mathbf{Cospan}_{\text{conn}}) = \begin{array}{ccc} & S_5: \begin{array}{ccc} & 1 & \\ \nearrow & & \nwarrow \\ 1 & & 1 \end{array} & \\ & \swarrow \quad \searrow & \\ S_2: \begin{array}{ccc} & 1 & \\ \nearrow & & \nwarrow \\ 1 & & \emptyset \end{array} & & S_3: \begin{array}{ccc} & 1 & \\ \nearrow & & \nwarrow \\ \emptyset & & 1 \end{array} \\ & \swarrow \quad \searrow & \\ & S_1: \begin{array}{ccc} & 1 & \\ \nearrow & & \nwarrow \\ \emptyset & & \emptyset \end{array} & \end{array}$$

$\sigma(\mathbf{Cospan}) \cong \mathbb{L}(\sigma(\mathbf{Cospan}_{\text{conn}}))$  is displayed as follows:

$$\begin{array}{ccccc}
 & & S_5 & & \\
 & & \vee & & \\
 & & S_4 & & \\
 S_2 & \triangleleft & & \triangleright & S_3 \\
 & & & & \\
 & & S_1 & & \\
 & & \vee & & \\
 & & S_0 & & \\
 & & \downarrow S_5 & & \\
 & & \cup & & \\
 & & \downarrow \{S_2, S_3\} & & \\
 S_2 & \subset & & \supset & S_3 \\
 & & & & \\
 & & \downarrow S_1 & & \\
 & & \cup & & \\
 & & \emptyset & & 
 \end{array} \cong$$

# ACC for $G$ -Set

$G$ : a topological group  $\rightsquigarrow$   $G$ -Set: locally connected

## Definition

$A \in \mathcal{E}$  is called an **atom**  $\stackrel{\text{def}}{\Leftrightarrow} A \neq 0$  and  $\text{Sub}(A) = \{0, A\}$ .

$$(G\text{-Set})_{\text{conn}} = \{\text{atoms in } G\text{-Set}\} \simeq \{\text{open subgroups of } G\}$$

## Corollary ([Kaw23b])

$G$ : a topological group

- ①  $\sigma(G\text{-Set}) \cong \mathbb{L}(\text{open subgroups of } G)$
- ②  $G\text{-Set}$  satisfies ACC  $\Leftrightarrow$  Every lower set of open subgroups of  $G$  is finitely generated.

Thank you!

# $\kappa$ -filtered colimits

## Definition

A small category  $\mathbb{I}$  is  $\kappa$ -filtered if every  $(< \kappa)$ -small diagram has a cocone in  $\mathbb{I}$ .

## Definition

A  $\kappa$ -filtered colimit is a colimit of a functor from a  $\kappa$ -filtered small category.

# Representing models

## Theorem ([Kaw23a; Kaw24])

$\mathbb{T}$ : a  $\kappa$ -ary partial Horn theory

For every  $\mathbb{T}$ -model  $M$ , we have:

$$\llbracket \vec{x}.\varphi \rrbracket_M \cong \mathbf{PMod} \, \mathbb{T}(\langle \vec{x}.\varphi \rangle_{\mathbb{T}}, M).$$

## Definition

An object  $A \in \mathcal{A}$  is  **$\kappa$ -presentable** if its Hom-functor

$$\mathcal{A}(A, -): \mathcal{A} \rightarrow \mathbf{Set}$$

preserves  $\kappa$ -filtered colimits.

## Theorem ([Kaw23a; Kaw24])

$\mathbb{T}$ : a  $\kappa$ -ary partial Horn theory

TFAE for a  $\mathbb{T}$ -model  $M \in \mathbf{PMod} \, \mathbb{T}$ :

- ❶  $M$  is  $\kappa$ -presentable.
- ❷ There exists a  $\kappa$ -ary Horn formula  $\vec{x}.\varphi$  s.t.  $M \cong \langle \vec{x}.\varphi \rangle_{\mathbb{T}}$ .

# Example: UDO semirings

## Example ([Gol03])

A **uniquely difference-ordered semiring** consists of:

- a base poset  $(R, \leq)$ ;
- total operators  $+, \cdot: R \times R \rightarrow R$ ;
- constants  $0, 1 \in R$ ;
- a partial operator  $\ominus: R \times R \rightarrow R$  such that

$$b \ominus a \text{ is defined iff } a \leq b$$

which satisfy the following:

- $(R, +, \cdot, 0, 1)$  is a semiring;
- $a \leq a + b$ ;
- $(a + b) \ominus a = b$ ;
- $a + (b \ominus a) = b$  whenever  $a \leq b$ .

UDO semirings are algebras over posets.

# Example: partial abelian groups

## Example ([BH12])

A **partial abelian group** consists of:

- a base set  $A$  with a reflexive symmetric relation  $\odot \subseteq A \times A$ ; (a set with commensurability)
- a constant  $0 \in A$ ;
- a total operator  $- : A \rightarrow A$ ;
- a partial operator  $+ : A \times A \rightharpoonup A$  such that

$$a + b \text{ is defined iff } a \odot b$$

which satisfy the following:

- $a \odot 0$ ;
- $a \odot (-b)$  whenever  $a \odot b$ ;
- $a \odot (b + c)$  whenever  $a \odot b, b \odot c, c \odot a$ ;
- $(a + b) + c = a + (b + c)$  whenever  $a \odot b, b \odot c, c \odot a$ ;
- $a + b = b + a$  whenever  $a \odot b$ ;
- $a + 0 = a$  and  $a \odot (-a) = 0$ .

## Definition

A **monoid-graded set** is a map  $d: X \rightarrow M$  from a set  $X$  to a monoid  $(M, \cdot, e)$ .

## Example

A **monoid-graded ring** consists of:

- a base monoid-graded set  $(X, d, M, \cdot, e)$ ;
- a constant  $1 \in X$ ;
- total operators  $\otimes: X \times X \rightarrow X$ ,  $0: M \rightarrow X$ ,  $-: X \rightarrow X$ ;
- a partial operator  $+: X \times X \rightharpoonup X$  s.t.  $x + y$  is defined iff  $d(x) = d(y)$

which satisfy the following:

- $d(1) = e$ ,  $d(x \otimes y) = d(x)d(y)$ ,  $d(0(a)) = a$ ,  $d(-x) = d(x)$ ;
- $d(x + y) = d(x)$  whenever  $d(x) = d(y)$ ;
- $(x \otimes y) \otimes z = x \otimes (y \otimes z)$ ,  $1 \otimes x = x = x \otimes 1$ ;
- $x + 0(d(x)) = x$ ,  $x + (-x) = 0(d(x))$ ;
- $(x + y) + z = x + (y + z)$  whenever  $d(x) = d(y) = d(z)$ ;
- $x + y = y + x$  whenever  $d(x) = d(y)$ ;
- $(x + y) \otimes z = x \otimes z + y \otimes z$  and  $z \otimes (x + y) = z \otimes x + z \otimes y$  whenever  $d(x) = d(y)$ .

# Closed monomorphisms

## Definition ([Kaw23a; Kaw24])

Let  $\mathbb{T}$  be a  $\kappa$ -ary partial Horn theory over an  $S$ -sorted  $\kappa$ -ary signature  $\Sigma$ .

- ① A monomorphism  $A \hookrightarrow B$  in  $\mathbf{PMod} \mathbb{T}$  is called  **$\mathbb{T}$ -closed** (or  **$\Sigma$ -closed**) if the following diagrams form pullback squares for any  $f, R \in \Sigma$ .

$$\begin{array}{ccc} \mathrm{Dom}(\llbracket f \rrbracket_A) \hookrightarrow \prod_{i < \alpha} A_{s_i} & & \llbracket R \rrbracket_A \hookrightarrow \prod_{i < \alpha} A_{s_i} \\ \downarrow \quad \lrcorner & & \downarrow \quad \lrcorner \\ \mathrm{Dom}(\llbracket f \rrbracket_B) \hookrightarrow \prod_{i < \alpha} B_{s_i} & & \llbracket R \rrbracket_B \hookrightarrow \prod_{i < \alpha} B_{s_i} \end{array}$$

- ② A morphism  $h: A \rightarrow B$  in  $\mathbf{PMod} \mathbb{T}$  is called  **$\mathbb{T}$ -dense** (or  **$\Sigma$ -dense**) if  $h$  factors through no  $\mathbb{T}$ -closed proper subobject of  $B$ .

# Local retracts

## Definition ([Kaw23b; Kaw24])

A morphism  $p: X \rightarrow Y$  in a category  $\mathcal{A}$  is called a  **$\kappa$ -local retraction** if for every  $\kappa$ -presentable object  $\Gamma \in \mathcal{A}$  and every morphism  $f: \Gamma \rightarrow Y$ , there exists a morphism  $g: \Gamma \rightarrow X$  such that  $p \circ g = f$ .

$$\begin{array}{ccc} & X & \\ \nearrow \exists g & \downarrow p & \\ \Gamma & \xrightarrow{f} & Y \end{array}$$

A  $\kappa$ -local retraction is also called a  $\kappa$ -pure quotient in [AR04].

## Definition ([Kaw23b; Kaw24])

Let  $U: \mathcal{A} \rightarrow \mathcal{C}$  be a functor. A morphism  $p$  in  $\mathcal{A}$  is called a  **$(U, \kappa)$ -local retraction** if  $Up$  is a  $\kappa$ -local retraction in  $\mathcal{C}$ .

# The ascending chain condition for categories

## Example ([Kaw23b])

- 1 **Set**, **Pos**, and **Ab** satisfy ACC.
- 2 **Ring** and **Lat**<sub>0,1</sub> **do not** satisfy ACC.
- 3 **Set**<sup>*S*</sup> satisfies ACC  $\Leftrightarrow S$  is finite. (*S*: a set)
- 4 *S*/**Set** satisfies ACC  $\Leftrightarrow S$  is finite. (*S*: a set)
- 5 **Set** <sup>$\rightarrow$</sup>  satisfies ACC.
- 6 **Set** <sup>$\cdot \Rightarrow \cdot$</sup>  **does not** satisfy ACC.
- 7 **Set** <sup>$\omega$</sup>  satisfies ACC.
- 8 **Set** <sup>$\omega^{\text{op}}$</sup>  **does not** satisfy ACC.
- 9 The category **URel** of sets with a unary relation satisfies ACC.
- 10 The category **BRel** of sets with a binary relation **does not** satisfy ACC.
